01

# Introdução

# Problema da Mochila

- Problema clássico de otimização combinatória.
- Selecionar itens para colocar em uma mochila com capacidade limitada, de forma a maximizar o valor total dos itens escolhidos sem ultrapassar o limite de peso.

# Aplicações

- Planejamento de viagens;
- Transporte de veículos;
- Investimentos financeiros.

02

# Estrutura do Agente

# Estrutura do Agente

# Método de Aprendizagem

- Algoritmo Genético;
  - Simula a seleção natural, inspirada na teoria de Darwin;
  - Começa com a geração de uma população inicial de soluções aleatórias;
  - Cada solução é avaliada pela função de fitness, que mede quão boa ela é;
  - Melhores soluções são selecionadas para reprodução
    - Crossover gera novas combinações de soluções;
  - Aplicamos mutações aleatórias em algumas soluções.
